Title: PPDG Site AAA

The Particle Physics DataGrid formed a subgroup in 2002 to look at Site Requirements for Authentication, Authorization, and Auditing. The purpose was to engage the five large DOE HEP laboratories' security infrastructure personnel in evaluating the current Grid toolkits and articulating requirements from large Resource Provider perspectives. The project brought experts in security and operations together with middleware application developers. Extensive discussions (including counterpart groups within the European DataGrid and Global Grid Forum) greatly clarified the understanding of core issues and honed proposed solutions. This talk will review the project, summarize the conclusions and results.
